Current stage

LOCATION

Tolima

Department

Ataco - Chaparral

Municipality(ies)

Ataco - Chaparral

Municipality(ies) area of influence

Geovisor Anna MINERÍA

MAIN INFORMATION

USD \$ 6 million

Global investment

-

Executed investment

-

Start of construction

-

Start of operations

-

Employment

Type of project

- New (greenfield)
- Enlargement (brownfield)
- Replacement (brownfield)
- Reutilization (greenfield)

Alluvial Gold

Type of deposit

In evaluation

Reservas minerales (ECRR standard)

In evaluation

Recursos minerales (ECRR standard)

Open Pit

Type of mine

16 years with extension possibility

Mine life cycle

-

Plant capacity

-

annual production – last year or estimated

CURRENT STATUS OF THE PROJECT

Stage progress:

- Pre-feasibility
- Feasibility
- Detail engineering
- Construction

Project is currently in the pre-feasibility stage.

Adherence to initiatives and best practices:

GOLIAT S.A.S. is a mining company dedicated to the technical exploitation and economic use of minerals, which develops its activities within the framework of Sustainable Development, restoring the areas intervened for mining and compensating for the impacts that cannot be corrected or mitigated. Responsibility and compliance with environmental regulations are the priority of GOLIAT S.A.S.

Environmental License (CAR)

- Requested
- Under consideration
- Approved

Baseline studies are currently being prepared for submission of the Environmental Impact Assessment (EIA) to the environmental authority.

Main achievements in social management

Works and construction program - PTO (National Mining Agency)

- Submitted
- Under evaluation
- Approved

Auto PAR-I No. 0408 of 24/05/2018.

Additional project data: Geologically, the gold deposits are in Placer-type Alluvium, formed mainly by coarse material, gold associated with orogenic belts and volcanic arcs of the Cenozoic-Mesozoic, from the fluvial action of the Saldaña River. According to studies by the Colombian Geological Survey - SGC (2019), the Saldaña River is considered one of the sources of placer gold in Colombia.

The alluviums are between 5 and 20 m deep; the metal is concentrated in the lower part above the bedrock, in a belt of 0.7 m average thickness. Layers of unconsolidated material throughout the lithological column facilitate the operation with hydraulic equipment. In the mining title area, magnetic and geoelectric prospecting studies have been carried out to characterize the alluvium.
